Abstract:

Sprites and synthetic imaging are useful technologies for web application development. A sprite is a collection of images grouped into a single image. A synthetic image is a procedurally defined image of composited image elements, filters, shapes, gradients, and text. With the widespread browser support for transparent 32 bit PNGs, sprites are rapidly becoming a requirement for rich media design and dynamic websites. SpriteML is an XML markup language used to procedurally define images, animations, and sprites. The SpriteML processor is command line driven, easy to understand, and easy to use. SpriteML is open source under the GNU General Purpose License 3.0 and is freely available for download. In this paper, we present a high level overview of the SpriteML system, its benefits, and how it fits within a web development workflow.
